

## What is PAE ?

Prostatic artery embolization (PAE) is a minimally invasive treatment that helps improve lower urinary tract symptoms caused by a Benign Prostatic Hyperplasia (BPH).

## Procedural Details

- PAE is performed by an Interventional Radiologist through a small catheter inserted into the artery in your wrist or groin.
- The interventional radiologist will then guide the catheter into the vessels that supply blood to your prostate.
- Tiny round microspheres (particles) are injected through the catheter and into the blood vessels that feed your prostate to reduce its blood supply
- Following this procedure, the prostate will begin to shrink, relieving and improving symptoms usually within days of the procedure.

## What are the Advantages of PAE ?

Prostatic artery embolization (PAE) is a minimally invasive treatment that helps improve lower urinary tract symptoms caused by a Benign Prostatic Hyperplasia (BPH).

**No surgical incision or device inserted into the urethra.**

**Performed in an outpatient setting under "twilight sleep" with no general anesthesia.**

**Painless procedure lasting approximately 1 hour.**

**Very low complication rate and no reports of impotence or incontinence after PAE .**

**Symptom improvement occurs 2-3 weeks after the procedure.**

**Return to full activity within one week.**

## By the numbers

As many as 14 million men in the United States have symptoms of BPH

80-90% effective in reduction of symptoms

5-7 years durability for relief of symptoms

By age 60, 50% of men will have some signs of BPH
